Project Scope:

Staheli Trenchless Consultants is very excited about the opportunity to participate as authors of Section 2-16 Horizontal Directional Drilling and Section 2-17 Auger Boring of the upcoming City of Seattle Standard Specifications update. These specifications have now been updated taking into account the existing capabilities of the HDD and auger bore construction methods.

Staheli Trenchless worked closely with the City of Seattle to tailor the construction specifications to the needs of the City, taking into account the in-house expertise available to the agencies using the specifications and the range of application that the City required.

Using our diverse team of trenchless experts, STC created a performance based specification drawing from key design criteria based upon a combined 50 years working on HDD and Auger Bore installations including experience on both the consulting and contracting side of the trenchless industry. In addition STC has designed and provided specialty trenchless construction inspections on many projects in the pacific northwest and in the Seattle Area.

See a sampling of the drilling and boring equipment used on STC auger bore and HDD projects in the Greater Seattle Area below and go to our website at www.stahelitrenchless.com to see the extensive project experience and technical expertise that STC uses to develop guidance documents and provide expert services. STC strongly believes that all design should be done by engineers with a strong technical background coupled with an understanding of what has worked in the field in the past. Check out the complex and challenging installations we've been a part of and see the experience we can bring to your project.
